ILLUSTRATED MMS:

Qualitative application versus Quantitative concentration

The premise here is the true value of money is the net of how well it is used (qualitative) application, not dominantly how much there is, where it is, and who has it.

As and for a visual:

Imagine

<

a gazillion cigarettes

a zero emissions car

Unarguably, every other negative aside, the cigs consume precious oxygen when ignited. It doesn't matter that this oxygen is drawn from a vast supply of planet atmosphere. Parallel to the oceans, and the need to keep them contaminant free, no unnecessary pollution of our air should be tolerated.

The electric car, on the other hand, does not.

For this reason, first recognizing, then rewarding preferred use of money is the correct principle to being full fledged masters of economy, rather than having such activity unduly or overly influence our economic decisions.

Man should be the master of money, not the other way around.
